What is a Rolaram® Linear Actuator?

Rolaram® is an electro-mechanical linear actuator, which consists of either a Spiracon™ planetary roller screw or a ball screw, driven by an electric motor, through a reduction gearbox. The lead screw converts rotary motion to linear movement. As the screw rotates, the nut extends and retracts the ram, which is attached to the load.

Parallel Configuration

The Spiracon™ Roller Screw

This unique patented system consists of a multi-start screw with an involute thread form and a number of planetary rollers with annular grooves, which engage with the screw. These rollers also engage with a grooved load bearing element, which transmits the load through roller thrust bearings, to the nut housing. The rolling action results in a high efficiency mechanism, while the line contact and hardened and ground construction achieves a high dynamic load carrying capacity, along with almost no axial backlash or wear.

Spiracon Nut

Main features of Rolaram® Actuators

- High efficiency screw mechanism and gearbox
- High dynamic load capacity and wide speed range
- Controllable for synchronisation
- Precise repeatability of positioning
- Long life and low maintenance and running costs
- Clean operation and low noise
- Cost effective package
- Guided ram option

Advantages over other Actuators

Rolaram actuators can not only match the load capacity of hydraulic cylinders and exceed the load capacity of conventional electro-mechanical actuators but also provide:

- Easy installation, no pipework, powerpack and valves
- Easy synchronisation of more than one unit
- Accurate and repeatable positioning using simplified system
- Low power consumption and running costs
- No oil leaks, contamination or fire risk
- Low noise system
- Higher dynamic capacity, higher speed capability and longer life

Applications for Rolaram® Actuators

Rolaram actuators are well proven throughout the world in a wide variety of industries including

Nuclear Food Processing Aerospace Paper

Metal Processing Offshore and Marine Medical Communications Automotive Defence Typical applications include:

Scissor lifts, lifting platforms, robotics, continuous paint pumps, medical beds, coiling/decoiling machines, tundish cars, continuous operation process lines.

Drive Configurations

Right Angle

Parallel

In-Line

Application

Wimbledon Centre Court and Court-1 automated roof segment sealing locks

Linear Actuation Requirements

Roof mounted precision actuator to lock and unlock each roof segment to ensure 100% water sealing. Fully exposed to the weather on the roof.

Solution

36 Rolaram® actuators operate on the roof to lock and unlock each segment. Each of the actuators is designed to have a peak load rating of 160kN to withstand forces exerted by nature. They operate at 1500 mm/min over a 400mm stroke with the useable stroke set by limit switches integrated into the actuator. Drive for the actuator is provided by an electric brake motor with an IP66 weatherproof enclosure. Both motor and limit switches connect to the electrical control and power systems via plug-in connectors for quick and easy installation. The actuator is mounted in the roof using a trunnion to clevis type arrangement that allows the actuator to pivot through an arc as it operates.

Application

Die splitter for opening up 20 tonne die sets, prior to their use in the production of car body panels.

Linear Actuation Requirements

Dies require to be split evenly, with all corners being moved simultaneously, within 5 microns of each other.

Solution

4 identical Rolaram actuators mounted one on each corner of the die splitter. Each driven by a servo motor, controlled by a PLC, to ensure synchronisation of all 4 actuators, within the required limits of positional accuracy. Cranes were previously used to split the dies and the die splitter now represents a considerable time saving in preparing dies for production.

Application

European Community funded research project, to monitor the steering roll characteristics on a zincplating line for steel strip. The aim is to optimise downtime and repairs on the line.

Linear Actuation Requirements

5 axis control of the steering roll (X, Y, Z and tilt), to a repeatable positional accuracy of less than 10 microns.

Solution

5 Rolaram actuators, each driven by an AC synchronous servo motor, controlled by a Programmable Multi Axis Control System. The units are fitted with an incremental encoder, a load cell and backlash free gimble mounting.

Operating

Moving a maximum load of 270kg at a maximum acceleration of 1 metre/second² and a maximum speed of Characteristics 0.5 metre/second, to a repeatable accuracy of less than 10 microns.

Application

Changsha Maglev Railway turnout/points locking mechanism.

Linear Actuation Requirements

Precision actuator mechanism with high reliability to ensure the rail track is securely locked in position, enabling safe and efficient train movement.

Solution

R125 Rolaram linear actuators with precision roller screw in a housing sealed for outdoor use in exposed locations. The actuators operate at 6m/min and are equipped with safety brakes and auxiliary emergency backup drive.

Application

Grinding head adjustment to put precise tapers on camshaft cam lobes.

Linear Actuation Requirements

Moving a load of 270kg, on a continuous duty cycle, over an operating life of 10 years.

Solution

A single Rolaram actuator fitted with an AC servo motor and encoder.

Unit is sealed to prevent the ingress of abrasive dust.

Application

De-chocking car for removal and refitting of 14 tonne bearing assemblies (chocks) on steel rolls.

Linear Actuation Requirements

4 stage sequence of operation

- Locate car parallel & exactly on centre line of bearing assembly.
- High speed traverse to place lift platform under bearing assembly.
- Raise lift platform to sense load of 14Te bearing assembly, then move 75 microns to locate around tapered shaft of steel roll.
- Drive platform traverse to clear bearing assembly from shaft (slow speed) then locate bearing assembly on car (high speed).

Solution

A total of 2 Rolaram actuators and 6 Spiracon roller screws, to provide a combination of high speed (up to 45 m/min), very slow speed and micron accuracy. Since the de-chocking car has been installed, the time required to prepare rolls for changing at the mill stands has been reduced by up to 50%.

RR150AP-0300-0500-CT00-E1B0P10

R150 Rolaram Linear Actuator with Roller Screw Drive, Standard design with electric motor mounted parallel to ram, 300mm/min linear speed, 500mm stroke, Clevis End on ram, Standard Trunnion Mount on gearbox, 415VAC 3-Phase 50Hz induction motor with brake, no encoder feedback, 2 fixed proximity sensors for end of stroke position indication mounted in position-1, standard paint lubrication and seals.

Notes:

- #1 Trunnion mount distance / location on ram available as set position as standard for type of actuator, otherwise special design.
- #2 Rolaram with bevel gearbox drive with single or double drive shaft. Trunnion mounts concentric with drive shafts on gearbox side.
- #3 Low Duty Anti-Rotation - Keyed Ram (sliding guide)
- #4 Stainless Steel Ram - inner tube and end fitting all stainless steel.
- #5 Servo motor only
- #6 EOS = End Of Stroke
- #7 Adjustable to set end of stroke limits at each end by +/- 5mm.
- #8 Limit Switch radial position around circumference of actuator ram. 4 standard positions at 90 degree intervals (approx).
- #9 Rotary Limit Switch can only have "Limit Position 1" as shaft driven.
- #10 Power Jacks defined standard paint - available as a data sheet.
- #11 Power Jacks to defined standard lubricant - available as a data sheet and in manual to provide to customers.

There are 8 standard Rolaram models, available in 2 standard drive configurations, each with 10 linear speeds and offering a wide range of load capabilities. The R050, R075, R100 and R125 models are available in a Ball Screw version, for applications where positional accuracy is less important and a more cost effective solution is desired.

Where the standard range does not meet the application specification, special actuators can be designed to meet customers' specific requirements (refer page 11).

Dynamic Load Capacity and Linear Speed

Dynamic load capacity from 4 kN to 400 kN (0.4 to 40 tonnes). A wide choice of linear speeds is available, from less than 250 mm/ minute to 7000 mm/minute. The speed range is achieved by using a combination of gearbox ratios, screw leads and standard motor speeds. The load/speed curves below illustrate by model how the dynamic load capacity varies with linear speed.

Load/Speed Curves

Drive

The drive is a standard 415v 3ph AC brake motor, mounted either at right angles or parallel to the actuator ram. The motor is fitted with a brake as standard, to insure that despite the high efficiency screw and gear system, the actuator is self sustaining and will not back drive. High efficiency helical spur and spiral bevel gearing are used to achieve the choice of reduction ratios and the option of a right angle or parallel drive.

Stroke

Each model can be provided with a stroke length up to the maximum shown in the Technical Charts. Please note that these strokes allow for the maximum dynamic load in compression. For a tensile load, greater maximum strokes can be accommodated depending on the linear speed. Where the stroke required exceeds the maximum shown, or there is a high static load, please contact our Technical Sales Department.

Standard Features

- Right angle or parallel drive configurations
- Choice of end fittings - clevis, screwed end, top plate
- Trunnion mounting (with or without feet)
- Rear Clevis
- Proximity switches, encoder
- Ball screw version for R075, R100 and R125 models
- Guided ram

Operating Life and Duty

The actuator models listed in the Technical Charts are capable of very high operating lives (in excess of 10,000 hours for some high speed models). The ball screw version may have a lower life expectancy than the equivalent roller screw version. Due to the almost limitless number of possible configurations, please consult our Technical Sales Department for an estimate of life for individual applications. Continuous duty applications e.g. reciprocating pumping systems can also be realised.

Efficiency

The inherent high efficiency of the screw and helical spur and spiral bevel gear system combine to give an overall mechanical efficiency of typically 80%. Power consumption is therefore minimised and a compact actuator is assured.

Synchronisation

Synchronisation of two or more Rolaram actuators can be achieved in one of two ways, depending on the requirements of the application:

- Using encoders, synchronous motors or servo systems (i.e. each unit motorised)
- By linking the units mechanically with drive shafting, driven by one common motor

Positional Accuracy

The inherent accuracy of the roller screw and low backlash gearing provide repeatable positioning to within 0.005mm (5 microns), when the actuator is combined with a suitable drive and control system. Ball screw models have a positional accuracy of 50 microns.

Guiding the Load

Side loads on the actuator ram should be avoided by ensuring that the load is guided. The load guide mechanism should resist the torque developed at the ram by the screw mechanism, thus precluding the use of spherical end fittings. The guided ram option, which utilises rolling element followers, eliminates the need for torsional restraint and therefore allows flexibility in the choice of end fittings.

Mounting Position

The Rolaram actuator can be mounted for operation in any orientation.

Safety Features

- In the event of power failure, the fail-safe brake on the motor will maintain the position of the actuator
- Totally enclosed and sealed unit
- Built in proximity switches/limit switches
- Guided ram version

Operating Environment

All units are constructed and finished to suit industrial operating conditions. The actuator is sealed at the ram and including the standard brake motor is protected to IP55 enclosure. Normal operating temperatures are from -10°C to +50°C. However, Power Jacks products have been proven in very low operating temperatures (-30°C- Arctic) and in very high temperatures (+70°C- steelworks). Please contact our Technical Sales Department to discuss hostile or hazardous operating environments.

Lubrication and Maintenance

Rolaram actuators require only a minimum of maintenance during the normal operating life. Depending upon the duty, periodic lubrication should be carried out on the Spiracon roller nut, thrust housing and helical spur/spiral bevel gearbox, according to the application and our recommended maintenance instructions.

Specials

The Rolaram concept has been successfully applied in many varied "special" applications, requiring for example:

- Very high linear speed (over 50 metres/minute) or acceleration (over 3 metres/sec²)
- Very high dynamic load (over 1000kN)
- In-line drive configuration
- Special drive e.g. inverter, servo, DC, stepper
- Temperature extremes or hazardous environment (e.g. subsea)
- Built in load cell
- Special mounting or restricted space
- Very low noise (under 60dB)

There are 4 simple steps as follows :

Step 1

Using the load/speed curves on page 8, select the actuator model which has an adequate dynamic load capacity for the required linear speed. Positional accuracy and life considerations may dictate selection of the roller screw version for models R075, R100 and R125.

Step 2

Referring to the Technical Charts (page 11) for that model, select the nearest linear speed for the chosen right angle or parallel drive configuration.

Ball Screw		
Product Code	Linear Speed (mm/min)	Dynamic Load Capacity (kN)
B0500260	260	13
B0500440	440	11
B0500550	550	10
B0500700	700	9.5
B0501080	1080	8
B0501560	1560	7
B0502150	2150	6.5

Step 3

Check the required stroke is within the maximum stroke limit.

Frame Size	Max Stroke (mm) in Compression		Basic Weight (kg)
	63	80	
63	835	930	4.6
63	930	1025	4.6
63	1025	1120	4.6
80	1120	1215	5.5

Step 4

Choose the end fitting, mounting arrangement and other options required to complete the full product code shown on page 7.

(4)	(5)	(6)
4	0	0
0	S	T
0	E	

Example

Dynamic Load = 50 kN (in compression)

Linear Speed = 900 mm/minute Stroke= 1500 mm

Parallel drive configuration, unguided ram, fitted with a clevis end, trunnion mounting (without feet) and proximity switches.

Step 1

Using load/speed curves on page 8, select model R125.

Step 2

Referring to Technical Chart for Model R125-Parallel Configuration on page 11, select product code R1251040.

Step 3

The required stroke of 1500 mm is less than the maximum shown (1600 mm).

Step 4

The complete product code is therefore **R1251040-P-P-1500-C-TN-P-0**

General Rolaram Performance Summary

Load	Up to 400 kN (40 Te)	
Linear Speed	Up to 7000 mm/min	
Stroke	Up to 5000 mm	
Efficiency	80% (typical)	
Accuracy	Roller Screw	Up to within 0.005 mm (5 micron)
	Ball Screw	Up to within 0.05 mm (50 micron)
Operating Temperature	Normal	-10°C → +50°C
	Extreme (consult Power Jacks)	-30°C → +70°C
Life	10 000 hours typical as standard at full rated load and speed	
Enclosure	IP55

Roller Screw

Product Code	Linear Speed (mm/min)	Dynamic Load capacity (kN) ①	Motor		Max Stroke (mm) in Compression ②	Basic Weight (kg) ③
			Power (kW)	Frame Size		
On Application						

- Notes
1. Static load capacity = 19kN
 2. For tensile loads, greater maximum strokes can be accommodated, depending on linear speed.
 3. Total weight = basic weight + 2.2 kg (ball screw) per 100 mm stroke.
 4. All weights are approximate.

Limit Switches**Standard Rolaram® Actuator Limit Switch**

- Inductive proximity switches
- Cylindrical design M18 x 1
- Standard housing made from brass or stainless steel.
- DC-voltage
- Sizes: A = 60 mm, B = 51.5 mm

**Rolaram® Limit Switch Technical Data**

Parameter	Data
Type	Four-wire PNP/NPN/NO/NC programmable
Housing Material	Brass housing
Nominal Sensing Distance, S_n	5mm
Weight (kg)	0.120
Connecting Cable	4 core x 0.34mm ² , 2m long (other lengths available on request)
Degree of Protection	IP 68
Sensing Distance, S_s	0 → 4mm
Repeat Accuracy, R	3% of S_r
Differential Travel, H	1 15% of S_r
Operating Temperature	-25°C → + 80°C
Output State Indicator	LED
Voltage, U_o	12 → 24VDC
Operating Voltage, U_b (including residual ripple)	10 → 38VDC
Switching power, I	0 → 200mA, including overload and short circuit connection
Voltage Drop, U_d [output controlled]	2.6V
Residual Current, I_r [output locked]	-
Idle Current, I_s	10mA
Maximum Switching Frequency, f	2000Hz
Delay Times	Stand-by delay t_v = 5ms, switch-on time t_{on} = 1.15ms, switch-off time t_{off} = 0.35ms

Optional Rolaram® Actuator Limit Switch

Other limit switches can be supplied to suit most applications e.g:

- Different sizes, shape, design and enclosure electro-mechanical limit switches
- Inductive proximity sensor
- Hazardous Area rated electro-mechanical limit switch
- High or low temperature rated limit switches or sensors. For all of these options consult Power Jacks for details

Encoders for Rolaram® Actuators

Encoders for Rolaram linear actuators can be provided fitted to the rear of the electric motor (beneath the cowling). For further details please consult Power Jacks.

Optional Materials for Rolaram® Actuator Construction

As with all other Power Jacks products these actuators can be manufactured with alternative materials to meet the most demanding application. Consult Power Jacks for advice.

ATEX RATED ACTUATORS

Explosion-proof electric linear actuators with ATEX certification are specifically designed and produced to function safely in hazardous areas where flammable liquids, gases, vapours, dust, or other materials might ignite or explode. Power Jacks ATEX-certified linear actuators incorporate safety features throughout their design that limit the energy released in case of a malfunction, thereby preventing arcs or sparks that could ignite explosive or flammable substances.

- Linear Actuators engineered to meet each exact ATEX application requirements.
- Designed to prevent ignition in hazardous environments.
- ATEX directive compliant for reliable safe operation in defined hazardous area zones.
- Both mechanical and electro-mechanical designs are available, with a full range of electric motor, encoder, sensor, limit switch and gearbox options.
- Manufactured in a high-quality ISO compliant environment using the optimum materials, coatings and lubricants suitable for hazardous environments.
- Available full stainless steel designs for high corrosion resistance.
- Enclosure ratings up to IP68 (submersible) for operation in demanding environments.
- All accessories are ATEX rated for integration into suitable systems for full linear automation solutions in hazardous areas.

COMPLIANT STANDARD

Standard	Description
2014/34/EU	EU ATEX Equipment Directive
SI 2016/1107	UK ATEX Equipment Directive
BS EN 1127-1:2019	Explosive atmospheres. Explosion prevention and protection - Basic concepts and methodology
ISO 80079-36:2016	Non-electrical equipment for explosive atmospheres: Basic method and requirements
ISO 80079-37:2016	Non-electrical equipment for explosive atmospheres: Non-electrical type of protection constructional safety "c", control of ignition sources "b", liquid immersion "k"

ATEX ZONES AVAILABLE

Zone	Type	Category	Description
Zone 1	Gas / Vapour	Category 2G	Explosive atmosphere likely in normal operation
Zone 2	Gas / Vapour	Category 3G	Explosive atmosphere not likely; if it occurs, it is brief
Zone 21	Combustible Dust	Category 2D	Explosive dust cloud likely in normal operation
Zone 22	Combustible Dust	Category 3D	Explosive dust cloud not likely; if it occurs, it is brief

AUTOMOTIVE PAINT PUMP

Actuator

R150 model, roller screw version, in-line drive.

Application

Driving reciprocating, double acting paint pumps in the first all-electric paint mix facility in Europe.

Linear Actuation Requirements

The dynamic load is 17.9 kN in both directions, at a linear speed of 3 metres/minute

and a continuous duty cycle of 24 hours/day, 365 days/year. Each pump delivers 40 litres of paint/minute at 12 bar, 12 cycles/minute. The paint shop output is 30 cars/hour

(Phase 1) and 60 cars/hour (Phase 2).

Solution

Each pump is driven by a special R150 Rolaram actuator and a total of 31 actuator and pump systems are installed.

The actuator's features are:

- In-line configuration, minimizing the installation footprint
- Completely sealed unit, ensuring no contamination of the pumped medium
- Intrinsically safe, eliminating explosion risk
- Fitted with a keyed screw mechanism

An electro mechanical solution was preferred to pneumatics/hydraulics due to significantly reduced running costs, high life and reliability, high efficiency, low maintenance, low paint degradation and quiet operation.

SHEET STEEL PAINT COATING LINE

Actuator

B035 model, ball screw version, right angle drive.

Application

Positioning coater heads on sheet steel painting line for paint thickness control.

Linear Actuation Requirements

The actuator moves a dynamic load of 26 kN at a linear speed of 4 m/minute, over a stroke of 150 mm with 0.01mm repeatable positioning.

Solution

Each machine uses 6 Rolaram actuators. They are mounted on the machine via a special end flange mount on the outer tube which supports the full weight of the actuator. The actuator uses a special gearbox and ball screw assembly with zero axial backlash and is driven by an integrated servo motor mounted parallel to the ram.

TUNNEL VENTILATION

Actuator

Spring return actuator, ball screw version, in-line drive.

Application

Failsafe operation of ventilation dampers.

Linear Actuation Requirements

The actuator opens and closes the damper and maintains a 3 kN load to ensure that the damper is sealed. The damper must open and close in 2 seconds and operate at 250°C for 1 hour. In the event of power failure, the actuator must failsafe in the closed position.

Solution

One off ball screw actuator is fitted onto each damper. The actuator contains a pre-loaded spring and is fitted with a high temperature brake motor. The internal spring and drive configuration will allow the ram to retract automatically in the event of power failure. Three adjustable limit switch positions are provided and the stroke can be set within the allowable 120 mm, by adjusting these switches. All components are selected for the appropriate approved temperature requirement. The actuator has a fire test certificate for operation at 250°C for 1 hour.

MEDICAL SCANNER BED POSITIONING

Actuator

B100 model, ball screw version, parallel drive.

Application

Full body, multi purpose X ray examination table.

Linear Actuation Requirements

The dynamic load is 65 kN and high positional accuracy is required to achieve a defined axial play of the ram. Due to the clinical environment, the ability to tilt and elevate at the same time is unique and no other table on the marketplace is available with this feature. Operating in a medical environment, a major requirement of the actuators is low noise and the units cannot exceed 60 dB.

Solution

Two B100 ball screw Rolaram actuators, both parallel drive configurations, are fitted on each X ray table and they are synchronized for horizontal and vertical positioning through a complex servo control system. The actuators are tested to withstand 8 times the maximum load, without catastrophic failure. Due to space constraints, they are of a compact design and conform to strict aesthetic criteria.

FLOOD DEFENCE

Actuator

Special ruggedised Rolaram actuators in 3 bespoke design configurations

Application

The electric linear actuators play a pivotal role in averting the build-up of debris in a waterway during flood events. They are used to automate the lowering of bridge railings which would otherwise gather objects caught up in the flow – materials such as tree branches have previously combined to form a barrier that exacerbates local flooding.

Linear Actuation Requirements

Reliable actuation that is fast acting, highly corrosion resistant and housed in an anti-vandal enclosure.

Solution

4 actuators (1 at each end of the railing) in 3 bespoke designs to fit within the bridge structure with in-line and right angled drive configurations using extensive stainless steel components and driven by a 1-phase motor with everything rated for outdoor use. In case of local power supply failure the units are equipped with an interlock and a manual drive.

WATERWAY LEVEL CONTROL

Actuator

R175 model, roller screw version, right angle drive.

Application

Positioning a weir gate for water level adjustment.

Linear Actuation Requirements

The actuator moves a dynamic load of 150 kN (static load of 330 kN), at a linear speed of 240 mm/minute, has a stroke of 2700 mm and a life requirement of 40 years.

Solution

One actuator is fitted on each weir gate and has several special features:

- Universal joint at the ram end to compensate for misalignment and to resist the load torque
- Geared motor drive with hand wind facility
- Positional indication and end of travel limit switches
- Non contaminating grease

This application is in a remote location and an electro mechanical solution was preferred over hydraulics due to low power requirements, no expensive hydraulic power pack, no hydraulic fluid leakage i.e. no water contamination and minimal maintenance.

Power Jacks specialises in the design and manufacture of precision linear actuation, positioning and lifting equipment.

Our products are supplied globally across many sectors including Industrial Automation, Energy, Transport, Defence and Civil.
